### Safety light curtains

#### Presentation

#### Protection of personnel

Safety light curtains are electro-sensitive protective equipment (ESPE) designed for the protection of persons operating or working in the vicinity of machinery, by stopping the hazardous movement of parts as soon as one of the light beams is broken.

In particular, they provide protection to help ensure the **safety of personnel** operating hazardous machinery (annex IV of Directive 2006/42/EC) but they are equally suitable for use with many other types of machines. They make it possible to help protect personnel while allowing free access to machines.

The absence of mechanical protectors reduces the time required for loading, inspection, or adjustment operations as well as making access easier.

#### Directives and standards

#### Conformity to standards

Preventa XUSL2 and XUSL4 safety light curtains conform to the following standards:

- European Machinery Directive 2006/42/EC and European Use of Work Equipment Directive 2009/104/EC
- Low Voltage Directive 2006/95/EC and the Electromagnetic Compatibility Directive 2004/108/EC
- EN/IEC 61496-1 and EN/IEC 61496-2
- IEC 62061 and IEC 61508 (electro-sensitive protective equipment (ESPE))
- EN/ISO 13849-1
- EN/ISO 13855 (installation conditions, safety distances)

These light curtains are cULus and TÜV certified.

#### Application sectors

#### Main applications

Preventa XUSL2 and XUSL4 safety light curtains are used to detect fingers, hands, and bodies in the vicinity of hazardous machinery, such as:

- robotic systems
- assembly and packaging lines
- turret punch presses
- palletizers
- packaging machines
- assembly machines
- welding equipment
- handling equipment (rollers, winders, and unwinders)
- machine tools
- equipment for the agri-food industry
- mechanical and hydraulic presses

#### Safety rules

#### Detection of failures

##### Detection of failures liable to compromise safety and stopping of the machine

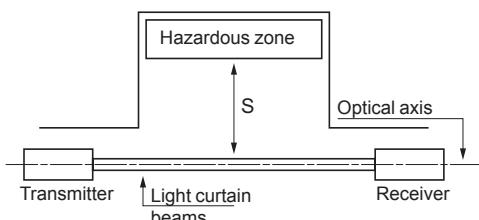

The design of the machine and its control system must be appropriate to the safety light curtain selected in order to immediately stop the machine's hazardous movement as soon as the hazardous zone, protected by the light curtain, is entered.

It must not be possible to enter the protected zone without breaking the light beams. The safety light curtain must therefore be installed in such a manner that the light beams cannot be avoided.

The machine can only be restarted if no hazard exists and no personnel are present in the hazardous zone.

The risk that persons might be inside the hazardous zone but out of the protective light beams must be addressed.

#### Positioning of safeguards

**Standard EN/ISO 13855 (1) defines the parameters for the positioning of safeguards. In particular:**

- the safety distance between the light curtain and the hazardous zone
- the body approach speed
- multi-beam devices
- multiple single-beam light curtains (2, 3, or 4 beams)

**Calculation of minimum safety distance S between the light curtain and the hazardous zone**

$$S = K(t_1 + t_2) + C \text{ (general formula)}$$

**S** = minimum distance in mm

**K** = approach speed of body (or part of the body) in mm/s

**t<sub>1</sub>** = response time of protection device in s

**t<sub>2</sub>** = stopping time of machine (hazardous movements) in s

**C** = additional distance in mm

- For multi-beam light curtains:

**K** = 2,000 mm/s

**C** = 8 (R - 14) where **R** = resolution of the safety light curtain mm

- For multiple single-beam light curtains or light curtains with 2, 3, or 4 beams:

**K** = 1,600 mm/s

**C** = 850 mm for multiple single beams

The protected heights are as follows:

Number of light beams	Protected height (mm)
4	300, 600, 900, 1,200
3	300, 700, 1,100
2	400, 900

#### Special rules for presses

The use of safety light curtains and mechanical protectors on metal working presses is governed by specific standards and rules.

The standards specify that safeguarding methods should be selected that reduce the risk as far as possible, considering the significant hazards and the production method so that, if a person enters the protective field while the hazardous movement is in progress, the machine stops as quickly as possible. "Quick stopping" means stopping of the ram before the operator can reach the hazardous zone, taking into account their speed of movement.

**The continuous self-monitoring function of safety light curtains is essential for metal working press applications.** If a failure is detected in the protection device, the potentially hazardous machine movement must be stopped automatically.

Once the protected zone is clear, the movement that was started and then interrupted by entry into the zone must not resume its normal travel, even after a Reset button has been pressed. Resetting must restart the movement from the beginning of the cycle. **The safety light curtain must only allow starting of a hazardous movement if its correct operation has been proved** (by pushing a test rod into the hazardous zone, or by means of an automatic device) and if a Reset button (start interlock) has been reactivated.

The safety distance S is calculated in a special way for:

- mechanical presses: refer to **EN 692**
- hydraulic presses, pneumatic folding machines, shears, bending and shaping machines: refer to **EN 693**

(1) To calculate the safety distance according to the standard applicable in the United States (OSHA 1910.217), refer to the calculation formulae given in the "Preventa XUSL User Manual".

## Preventa

### Safety light curtains

#### Functions and definitions

##### Resolution (R)

This is the smallest diameter (of an object) that type 4 or type 2 safety light curtains are able to detect with absolute certainty.

$$R = P + E$$

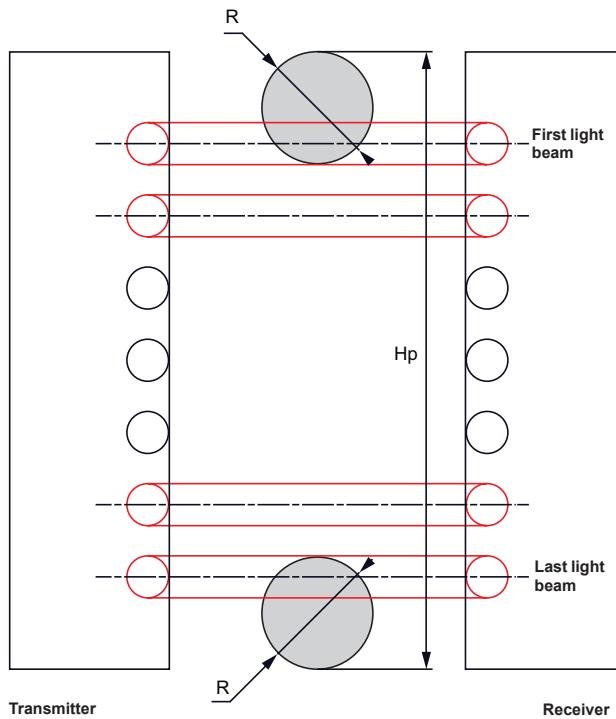

P: distance between the mid point of the 2 adjacent light beams

E: diameter of the light beams

R: resolution (or detection capability)

#### Protected height (Hp)

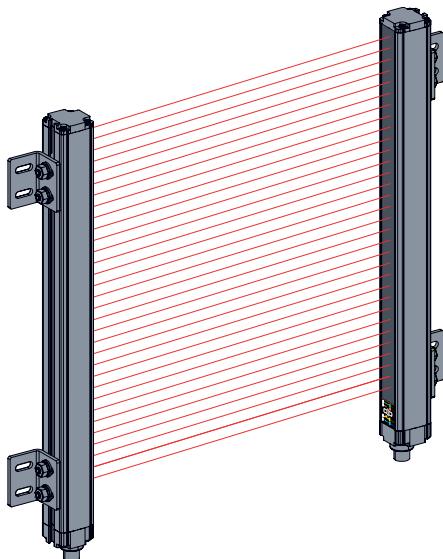

The protected height is the zone (or height) within which an object of diameter at least equal to the resolution (or detection capability) **R** is detected with absolute certainty.

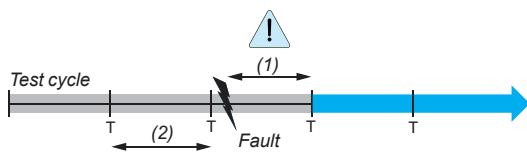

# Safety detection solutions

## Preventa

### Safety light curtains

**Operating fault detected for type 2 safety light curtain:**

(1) Risk  
(2) Test period: 500 ms

#### Functions and definitions (continued)

##### Operation of a safety light curtain

A safety light curtain is an optical protection system with infrared beams that provides protection for operators in the vicinity of hazardous zones. Any moving parts in this zone are stopped if at least one of the light beams is broken.

The system comprises a transmitter and a receiver positioned facing each other and controlled by a microprocessor. They are not physically interconnected. A row of diodes in the transmitter emits infrared beams to a row of photosensitive cells in the receiver.

The infrared diodes are triggered consecutively and the photosensitive cells are synchronized to detect the corresponding light beam only. When the detection zone is clear, both OSSD redundant outputs are enabled (ON) and the equipment connected downstream operates normally.

When an object larger than or equal in size to the resolution breaks at least one of the beams, both OSSD redundant outputs switch to the OFF state to send the stop command to the machine.

##### Type 2 and type 4 definitions

There are significant differences between XUSL2 (type 2) and XUSL4 (type 4) safety light curtains that need to be clarified. Types 2 and 4 are defined in standard IEC 61496-1.

It is the responsibility of the user or systems integrator to verify that the appropriate safety light curtain - type 2 or type 4 - is used according to the expected level of risk presented by the machine.

In order to select the correct product, it is necessary to carry out a risk assessment of the application.

##### Type 2

Type 2 safety light curtains test their internal circuits periodically (e.g. every 500 ms for XUSL2E). If a failure occurs between two test sequences, it will only be detected at the time of the next test.

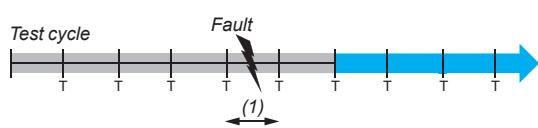

A type 2 device has reduced capability in comparison with a type 4 device (for example, it has a wider aperture angle and a longer response time).

These light curtains are designed for use in applications where the risk assessment has identified a low risk of injury to operators.

Type 2 light curtains are less expensive than type 4 devices due to their simplified architecture. They are only capable of hand and body detection.

XUSL2 safety light curtains are type 2 (IEC 61496-1), SIL 1 (IEC 61508), SILCL1 (IEC 62061), and PLC - Cat. 2 (EN/ISO 13849-1) compatible.

**Operating fault detected for type 4 safety light curtain:**

(1) Maximum response time

##### Type 4

In contrast to type 2 devices, type 4 safety light curtains are designed based on an automatic self-monitoring redundant architecture.

This architecture allows the immediate detection of a failure within a given response time.

Type 4 safety light curtains are suitable for applications where the risk assessment has identified moderate or high risk of injury to operators.

Type 4 safety light curtains are capable of providing finger, hand, and body detection. XUSL4 light curtains offer a shorter response time and a narrower beam aperture angle than XUSL2 light curtains.

XUSL4 light curtains are type 4 (IEC 61496-1), SIL 3 (IEC 61508), SILCL3 (IEC 62061), and PLe - Cat. 4 (EN/ISO 13849-1) compatible.

## Preventa

### Safety light curtains

#### Functions and definitions (continued)

##### Risk assessment

Risk assessment and risk reduction form part of an iterative process described in standards EN ISO12100, IEC 61496-1, IEC 61508, and IEC 62061 (SIL), and EN/ISO 13849 (PL).

There are different techniques for evaluating hazards, none of which can be considered as the best risk assessment method. The standards describe general principles, but do not specify precisely what to do in each case.

For safety-related data, refer to the PFHd (Probability of dangerous Failure per Hour" according to IEC 61508) value indicated for each XUSL2E and XUSL4E light curtain reference (see pages 10 to 17).

##### Response time

European standard EN ISO13855 incorporates the various aspects of response time in the formula for calculating the minimum safety distance. The total response time (T) corresponding to the overall stopping performance of the system is calculated using the following formula:

$$T = t_1 + t_2$$

**t<sub>1</sub>** is the response time of the protection device (in seconds).

It is the total time between detection by the device and switching of the output component.

Response time **t<sub>1</sub>** is indicated for XUSL2E and XUSL4E light curtains (see pages 10 to 17).

**t<sub>2</sub>** is the stopping time of the machine and, in particular, of its hazardous movements (in seconds).

This information is provided by the machine manufacturer. It is the time between the stop command and the actual stop of the hazardous mechanical components.

The response time of the machine control system (a relay or a safety controller for example) is included in "**t<sub>2</sub>**".

##### Selecting the sensing distance

Two different maximum sensing distances can be selected for each XUSL4E and XUSL2E safety light curtain: short and long.

Both sensing distances can be selected by wiring.

##### Sensing distance for XUSL2E safety light curtains

###### Hand and body detection, standard sensing distance:

Short sensing distance: 0...4 m. Long sensing distance: 0...12 m

##### Sensing distance for XUSL4E safety light curtains

###### Finger detection, standard sensing distance:

Short sensing distance: 0...3 m. Long sensing distance: 1...6 m

###### Hand and body detection, standard sensing distance:

Short sensing distance: 0...4 m. Long sensing distance: 0...12 m

###### Hand and body detection, increased sensing distance:

Short sensing distance: 0...10 m. Long sensing distance: 3...20 m

##### Sensing distance for XUSL2E safety light curtains with IP 69K sealed tube

###### Hand detection:

Short sensing distance: 0...3 m. Long sensing distance: 3...10 m

##### Sensing distance for XUSL4E safety light curtains with IP 69K sealed tube

###### Finger detection:

Short sensing distance: 0...2 m. Long sensing distance: 1...5 m

###### Hand and body detection

Short sensing distance: 0...8 m. Long sensing distance: 3...17 m

##### Automatic or manual start mode

AUTO/MAN (automatic/manual): this is what standard EN/IEC 61496 calls start (or restart) interlock of the safety light curtain:

- In AUTO mode: On power-up, if the detection zone is not occupied, or after the beams have been cleared, the safety light curtain resets itself automatically. Both OSSD outputs change to the "closed" position (ON).

# Safety detection solutions

## Preventa

### Safety light curtains

#### Functions and definitions (continued)

##### Automatic or manual start mode (continued)

- In MANUAL mode: On power-up (regardless of whether the detection zone is occupied or not), or after the beams have been cleared, the safety light curtain maintains both OSSD outputs in the "open" position (OFF). Pressing (and releasing) the reset button effectively resets the light curtain, if the detection zone is not entered. Both OSSD outputs change to the "closed" position (ON).

**Note:** In all cases, a general machine run command will trigger its start-up.

##### External device monitoring

External device monitoring (EDM) is an important safety function. It monitors the interface between the safety light curtains and the protected machine:

- to check that the external devices, such as contactors and relays, are responding correctly to the light curtain outputs
- to detect any inconsistency between the two external control devices that could prevent a stop command from reaching the equipment connected downstream (e.g. power contactors or solenoid valve relays)

The EDM controls the external contactors K1/K2. To do this, the NC contacts of the external contactors, connected in series, are monitored.

##### Test function

This function is designed to simulate entry into the detection zone (a break in transmission). An external control unit (e.g. a safety PLC) can then verify correct operation of the entire system (monitoring downstream equipment).

##### Signaling

LED display of operating modes and detected faults.

##### Muting function available with XPSLCMUT1160 module

Muting is the temporary suspension of the protection function provided by the safety light curtain. Activation or deactivation is achieved by means of standard sensors (OsiSense XU "dark on" photoelectric sensors with PNP output).

When activated, a signal is sent to the control system. This function is used to allow objects to access the hazardous zone during the process. Signaling informs the operator or operators that they are not protected.

#### Master/slave multi-segments for type 4 light curtains

Multi-segments help protect multiple zones via a series connection.

Only the first segment, known as the "master", is connected to the control cabinet or enclosure.

This master segment, which can detect fingers, hands, or bodies, can support up to 2 other intermediate segments, known as "slaves", connected via extension cables to the M12 connectors on the top of the segment.

Slave segments can be of different resolutions (R) and protected heights than the "master", without restricting the overall protected height.

They are totally dependent on the functions configured in the master segment.

The maximum distance for connection cables between 2 slave segments is 50 meters.

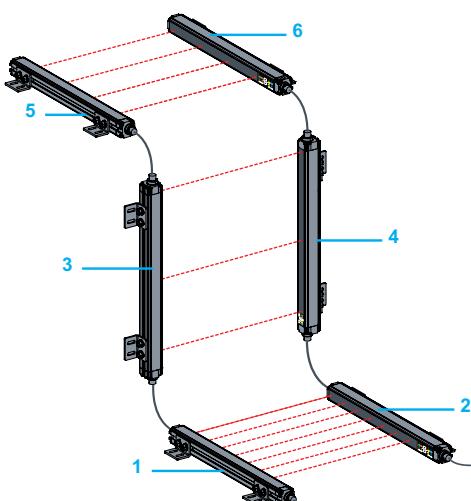

##### Light curtains with IP 69K sealed protection tube

Safety light curtains with protection tube are supplied mounted and pre-wired. The materials used are suitable for the food industry.

The sealed tubes provide additional protection to the light curtains against humidity, condensation, cleaning products, and certain chemical products.

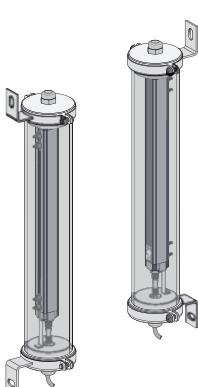

Light curtains with sealed protection tube can be supplied as follows:

- Operating temperature **with** heating system: -25° to +55 °C
- Operating temperature **without** heating system: -10° to +55 °C

Master/slave multi-segments light curtains:  
example of daisy-chained function

- 1 Master (transmitter)
- 2 Master (receiver)
- 3 Slave 2 (transmitter)
- 4 Slave 2 (receiver)
- 5 Slave 1 (transmitter)
- 6 Slave 1 (receiver)

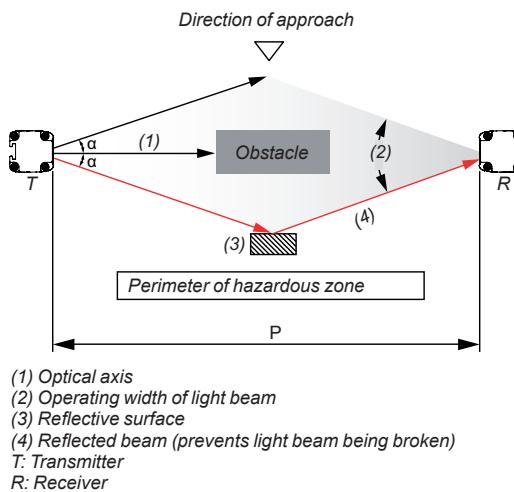

Light curtains with IP 69K sealed  
protection tube

# Safety detection solutions

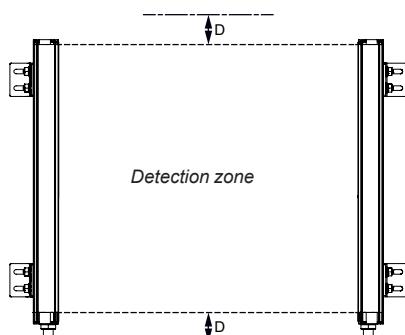

## Preventa

### Safety light curtains

#### Reflective surface positioned sideways:

#### Reflective surface positioned lengthways:

#### Installation precautions

##### Reflective surface

The devices must be installed such that the transmitter and associated receiver are mounted facing each other and correctly aligned for both height and angle.

The aperture angle of the optics and transmitter/receiver alignment tolerance are:

$$\alpha = 2.5^\circ \text{ (type 4)}$$

$$\alpha = 5^\circ \text{ (type 2)}$$

Reflective surfaces located alongside the optical axis could result in stray reflections interfering with the light beams that are the furthest away from the axis and, consequently, prevent detection of an object entering the hazardous zone. The direct light beam could then be joined by a stray reflected beam and this latter beam would not be broken when the object is in the axis.

For this reason, EN/IEC 61496-2 specifies a minimum distance **D** whereby:

##### For type 2 (XUSL2E light curtains):

If  $P \leq 3$  m, then  $D = 262$  mm

If  $P > 3$  m, then  $D = \tan(5^\circ) \times 1,000 \times P$  (m) =  $87.49 \times P$  (m)

**P** = Transmitter/Receiver distance (m)

**D** = minimum distance between the light curtain and reflective surface (mm)

##### For type 4 (XUSL4E light curtains):

If  $P \leq 3$  m, then  $D = 131$  mm

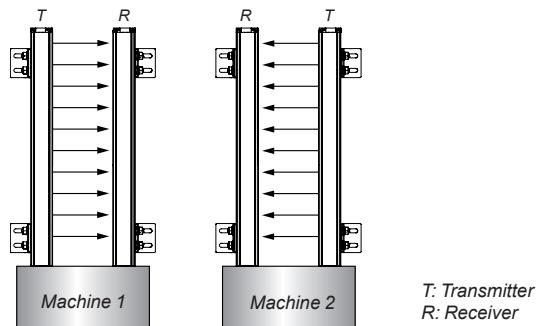

If  $P > 3$  m, then  $D = \tan(2.5^\circ) \times 1,000 \times P$  (m) =  $43.66 \times P$  (m)

#### Mutual interference

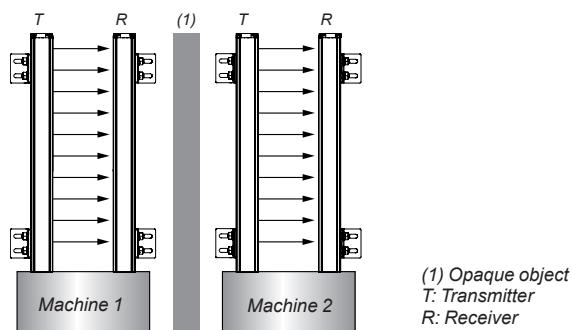

Certain installation configurations may require the installation of 2 (or more) safety light curtains side by side.

To help prevent interference between safety light curtains, the following installation is recommended.

#### Receivers installed back-to-back

#### Light curtains separated by an opaque object, to break the light beams one at a time

#### Installation precautions (continued)

##### Environments subject to interference

Industrial applications sometimes place products in extreme operating conditions, mainly due to:

- **Electromagnetic interference**

- conforming to level 3 according to EN/IEC 61496-1
- resistance to interference caused by variable speed drives

- **Light interference**

- conforming to EN/IEC 61496-2

#### Additional devices

Safety light curtains can only be used on machines on which the movement of working components can be **stopped at any time during a hazardous phase**.

These light curtains provide a stop signal, not a control instruction. This stop signal must be stored.

Clearing of the light curtain must not result in restarting of moving parts. Subsequent restarting must only be possible by means of deliberate operation of the appropriate control device, after having checked that there is no longer any danger.

**Electrical interfacing between the light curtain and the machine circuits must correspond to the machine standard specifications.**

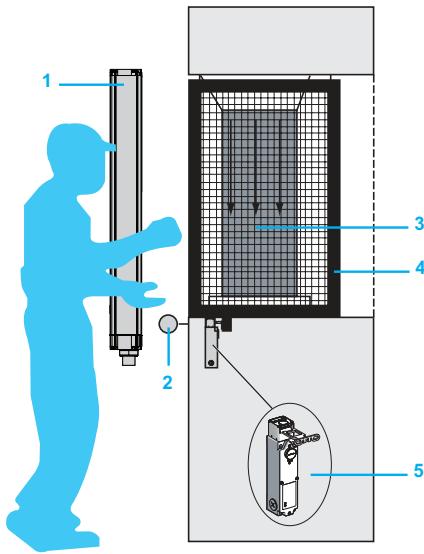

Where safety light curtains do not provide an adequate degree of protection due to their location, additional suitable protection devices or additional light curtains must be used in order to prevent operators from entering the protective light curtain and reaching the hazardous zone (EN/ISO 13857), or from remaining in the area between the hazardous zone and the safety light curtain (EN/ISO 13855).

The position and size of these additional protection devices must be such that it is **impossible for operators to reach the hazardous zone** in any way whatsoever (over the top, from beneath, from behind, or from the side) **without breaking at least one of the light curtain beams**.

These additional devices must be:

- either fixed  
(if possible, screwed or welded to the machine)
- or moving  
(with continuous monitoring of their position if they have to open)

It must be impossible for operators to disconnect or cut-out the switching circuits for these additional devices.

# Safety detection solutions

Preventa module XPSLCMUT1160

For the muting function on type 2 and type 4

Preventa XUSL light curtains

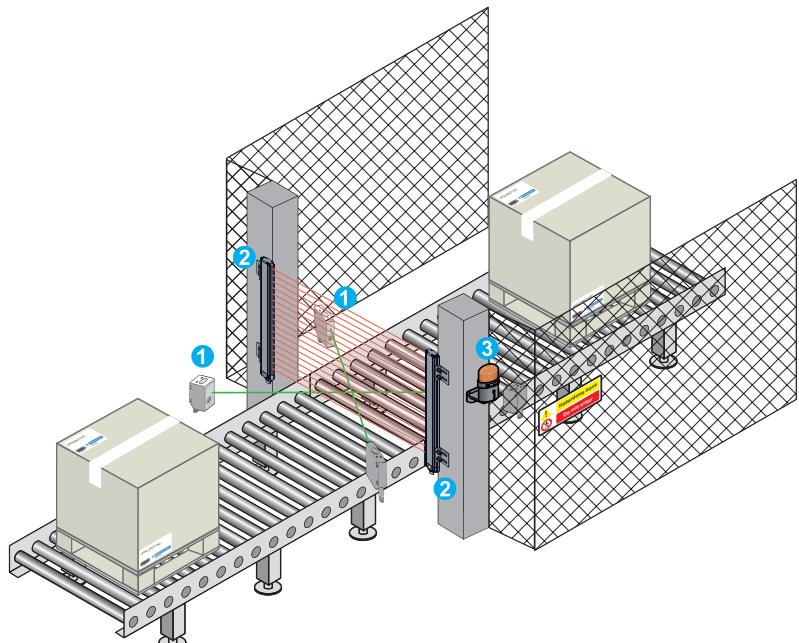

## Presentation

Muting is a temporary suspension of the protection function provided by the safety light curtain.

The function is activated or deactivated by means of standard sensors (OsiSense XU "dark on" photo-electric sensors with PNP output).

On activation, a signal is sent to the control system.

This function is used to allow objects to access the hazardous zone during the process. Signaling informs the operator(s) that they are not protected.

① Inhibition sensor (or muting sensor).

② Safety light curtain.

③ Muting indicator light.

The muting function (inhibition) effectively ignores the protective function on safety related control systems during a predetermined non-hazardous portion of the machine operation.

Muting mode is only active once the correct sequence of input signals on the inhibition (muting) sensors has occurred.

The purpose of selecting and orienting the inhibition sensors is to recognize the presence of a given part as the means of starting or stopping the inhibition sequence.

Any penetration of animate or inanimate objects into the sensing zone generating a different muting sensor sequence to the one defined, sends a stop signal to the guarded machine.

When the system is in muting mode, an indicator light must be on. This indicator must be visible to all personnel in the vicinity of the machine.

The **XPSLCMUT1160** module can be used with a type 2 or type 4 light curtain system.

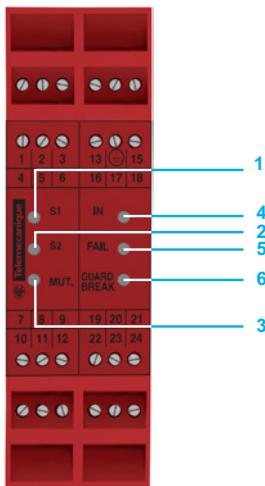

If the **XPSLCMUT1160** module is connected to a **type 4** safety light curtain, with two self-checking solid-state outputs, the system thus created conforms to type 4 (IEC 61496-1) SILCL3 (IEC 62061) and category PLC - Cat. 4 (EN ISO 13849-1:2008).

If the **XPSLCMUT1160** module is connected to a **type 2** safety light curtain, with two self-checking solid-state outputs, the system thus created conforms to type 2 (IEC 61496-1) SILCL1 (IEC 62061) and category PLC - Cat. 2 (EN ISO 13849-1:2008).

**Note:** The muting module response time should be added to that of the associated light curtain system.

XPSLCMUT1160

## Description

### Status LEDs

- 1 S1: status of muting sensor 1.
- 2 S2: status of muting sensor 2.
- 3 MUT.: status of muting function.
- 4 IN: status of safety light curtain OSSD outputs.
- 5 FAIL: absence or presence of failure.
- 6 GUARD BREAK: status of output relay/fault code.

## References

### Muting module

- Type 4 level of safety conforming to EN/IEC 61496-1 and EN/IEC 61496-2, SILCL3 conforming to EN/IEC 62061. Category 4, PLe conforming to EN ISO 13849-1: 2008.
- Supply voltage: 24 V  $\text{---}$ .
- 2 safety relays (NO contacts):
  - Switching capacity conforming to IEC 60947-5-1:  
AC-15 utilization category: 230 V  $\sim$ /2 A, DC-13 utilization category: 24 V  $\text{---}$ /2 A.
- B10d (safety relay outputs): 800 000
- Operating temperature range: 0°C...+ 55°C.
- Number of photo-electric sensors that can be connected: 2 (24 V  $\text{---}$ , PNP “dark on”).
- TM (mission time): 20 years.

Description	Connection type	Response time ( $t_r$ )	PFHd (1) IEC 61508	Reference	Weight
ms					kg
Module for muting function	Screw terminals	20 ms max.	6.42 x 10 <sup>-9</sup> to 5.03 x 10 <sup>-8</sup>	XPSLCMUT1160	0.150

## Cabling accessories

Female extensions with 8-pin M12 connector, used to connect the XPSLCMUT1160 module to the light curtain (receiver) (see page 23).

(1) PFHd: Probability of dangerous failure per hour (depends on the load controlled via output relays and the sorties and the frequency of demand).

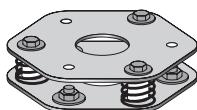

# Safety detection solutions

Preventa safety modules and associated single-beam photo-electric sensors with a test input, with built-in muting function

### Operating principle

XPSCM safety modules combined with XU2S single-beam photo-electric sensors (regularly tested) form a category 2 light curtain conforming to EN/IEC 61496 parts 1 and 2.

The connection of 1 to 4 pairs of XU2S photo-electric sensors makes it possible to create a protected zone up to 1,200 mm high conforming to EN 999/ISO 13855 and 8 m long.

The built-in muting function allows the automatic passage of parts to be machined or loaded pallets, without interrupting the transportation movement.

When the system is switched on by the start command (in series with the main circuit feedback loop) and the light protection is not interrupted, the main circuit is closed by the two safety relays in the XPSCM module.

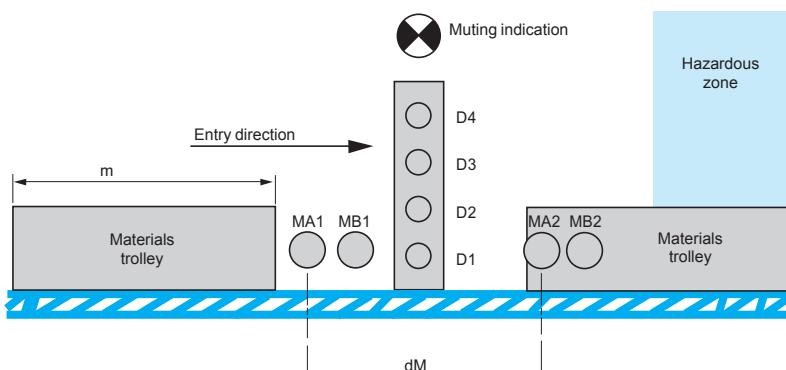

Interruption of the protection field causes the safety outputs to open instantaneously, and the process PLC receives a stop command. The LED on the XPSCM front panel changes from green to red. The "open" state is maintained until the module is restarted using the start button.

The muting function allows the light curtain protection to be inhibited. This can be used to authorize the passage of a materials trolley through the light curtain without tripping the main circuit. The muting function can only be activated by supplying the inhibition sensors if the safety outputs have been switched on beforehand.

To trigger the muting function, activate the inhibition devices within the 3-second time interval. This synchronization time for the two inhibition inputs can be deactivated by connecting two configuration terminals. The muting cycle lasts for a maximum of 60 seconds. During this period, materials can be transported through the protection field without deactivating the safety outputs. The 60-second limit value of the muting cycle can be made infinite by connecting two configuration terminals.

During the muting process, a light indicating the muting status is controlled by the XPSCM module. A fault at indicator light level (short-circuit, open circuit) will be recognized immediately and will deactivate the muting function. The indicator light comes on when a muting signal is generated and indicates inhibition of the protection function.

D1, D2, D3, D4: monitoring photo-electric sensors.  
 MA1, MB1, MA2, MB2: muting photo-electric sensors.  
 $m$  = trolley length.  $dM$  = distance between MA1, MB1 and MA2, MB2.

### Conditions to be observed for the muting function

- The muting sensors must either be:
  - Thru-beam type, sensing distance 8 m: XU2S18PP340L5 (or XU2S18PP340D).
  - Thru-beam type, sensing distance 15 m: XUB2BKSNL2T (or XUB2BKSNM12T) + XUB2BPANL2R (or XUB2BPANM12R).
  - Polarized reflex type, sensing distance 2 m: XUB9BPNAL2 (or XUB9BPNAM12) + XUZC50.
  - Polarized reflex type, sensing distance 5 m: XUM9APCNL2 (or XUM9APCNM8) or XUM9BPANL2 + XUZC50.
  - Mechanical limit switches.
- $dM \leq m$  to obtain continuous validation of the muting function.
- Avoid the intrusion by people during the muting phase. This phase is indicated by the indicator light connected to the muting indicator output of the XPSCM module.
- A materials trolley should generate the muting signal before entering the protection field and cease it once it has cleared all the sensors in the protection field on exiting.

# Safety detection solutions

Preventa safety modules and associated single-beam photo-electric sensors with a test input, with built-in muting function

## Safety modules

The **XPSCM1144** and **XPSCM1144P** safety modules are designed for monitoring single-beam photo-electric sensors with a test input, with built-in muting function.

- Maximum level of safety: PL = c, category 2 conforming to EN/ISO 13849-1, SILCL1 conforming to EN/IEC 62061 (1).
- Rated supply voltage: 24 V  $\text{---}$  (voltage limits: - 20...+ 20%).
- Operating temperature range: - 10...+ 55°C.
- Degree of protection: IP 20 (terminals), IP 40 (housing) conforming to IEC/EN 60529.
- Number of safety outputs: 2 (NO, volt-free).
- Additional outputs: 4 solid-state outputs (NO, 24 V  $\text{---}$ /20 mA).

XPSCM1144

Description	Response time ( $t_r$ )	PFHd (2) IEC 61508	Type of terminal block connection	Reference	Weight kg
		ms			kg
Safety modules	< 25 ms	3.12 x 10 <sup>-7</sup>	Integrated in module	XPSCM1144	0.350
